electroEnabling motor control (eEmc)

Lumbosacral
Neuromodulation
after Chronic SCI
(N=5)

Experimental design for percutaneous electrical spinal cord stimulation (PTES) in normal individual

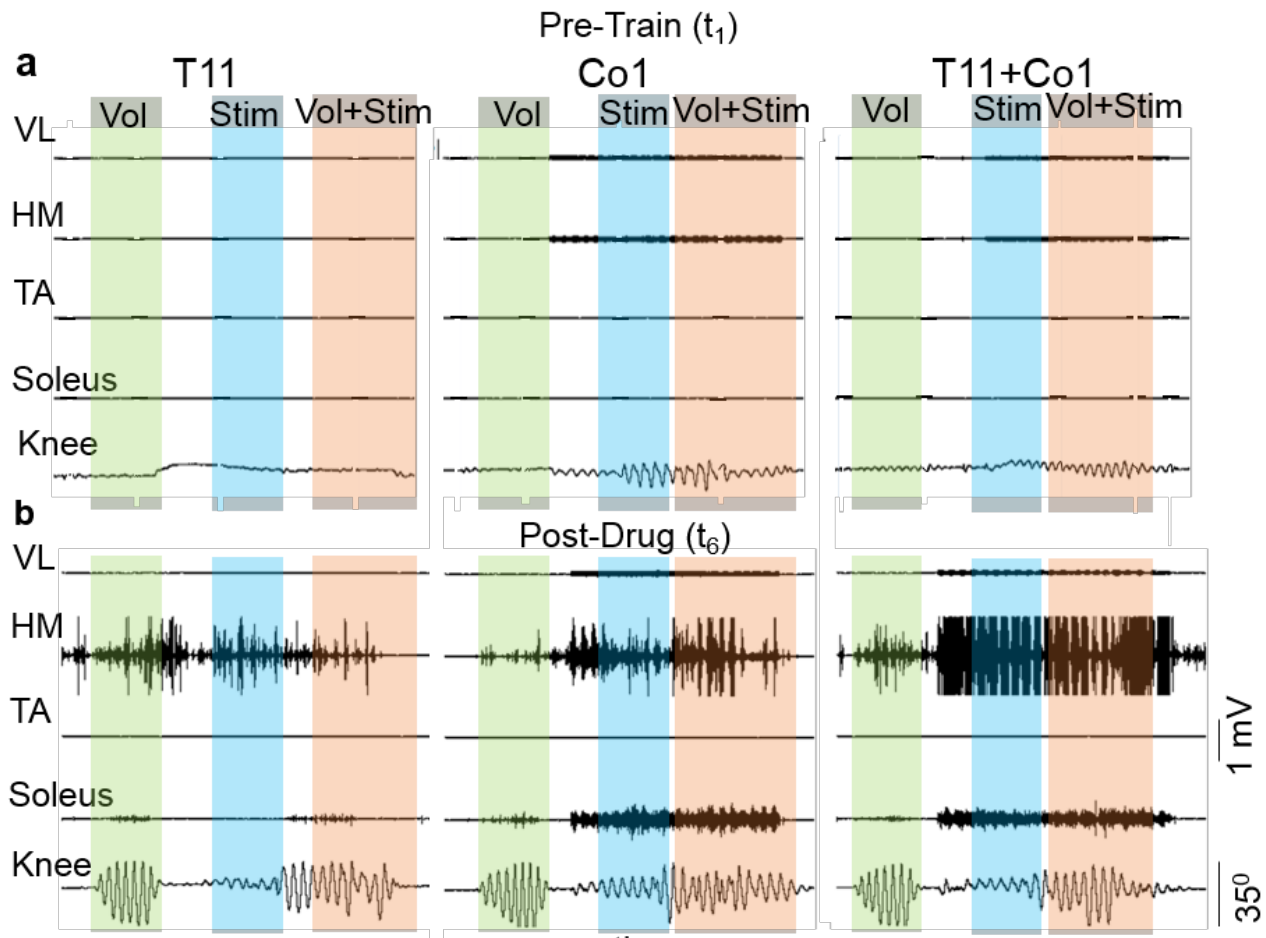

Гурфинкель и др. 1998; Selionov et al. 2009

“Russian” current

A 10kHz biphasic stimulation is delivered in 0.3 to 1ms bursts. These pulses are delivered at 1-40 Hz.

Non-invasive
Neuromodulation to
regain voluntary leg
movements after
complete paralysis

Combining pcEmc and Exoskeletal Assistive Devices (Ekso)

Cervical Spinal Neuromodulation

Before Injury

Left Paw Dominant

Post-Injury (1 week)

Same Representative Animal & Scale (amplitude, time)

Post-Injury (6 weeks) Sham Treatment

Right Paw Dominant

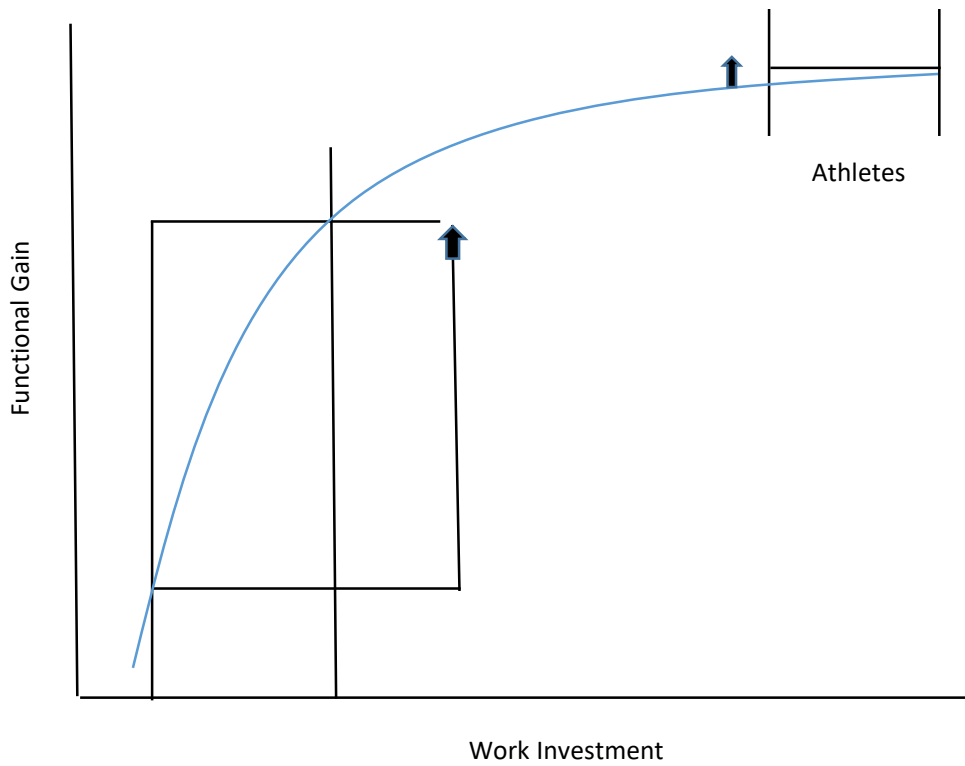

Buspirone Treatment

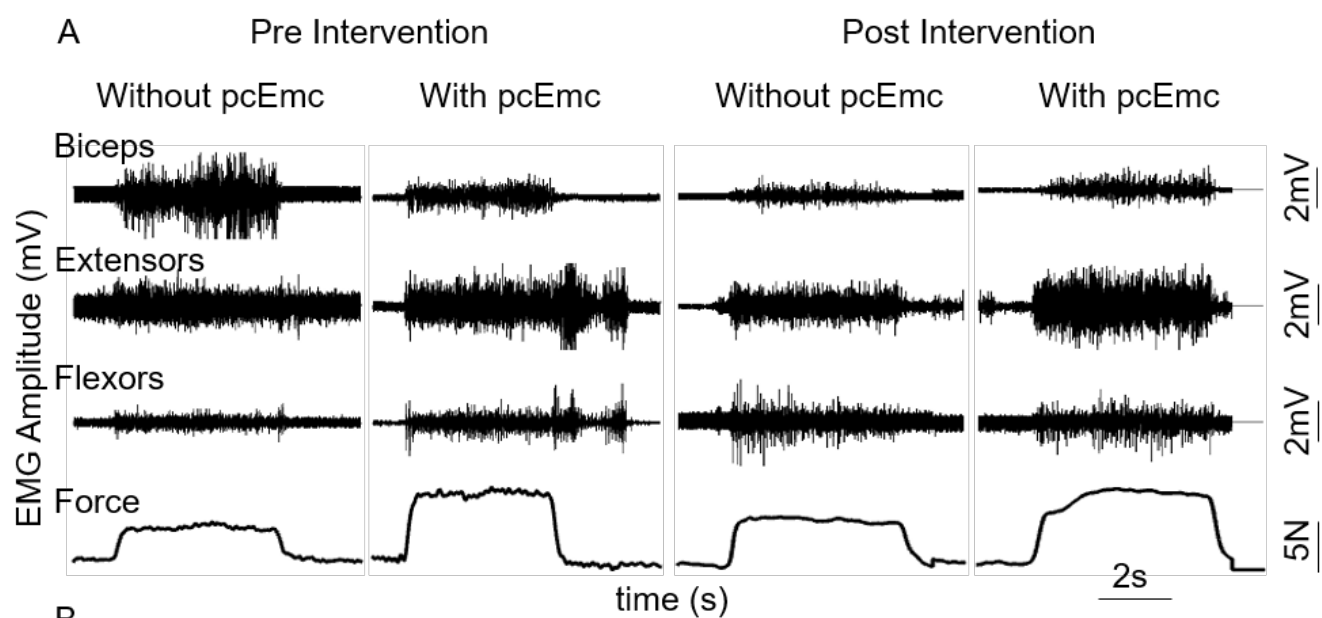

Left Paw Dominant

Same Representative Animals as Previous Slide

Non-Invasive
Neuromodulation to
regain hand grip
function after paralysis

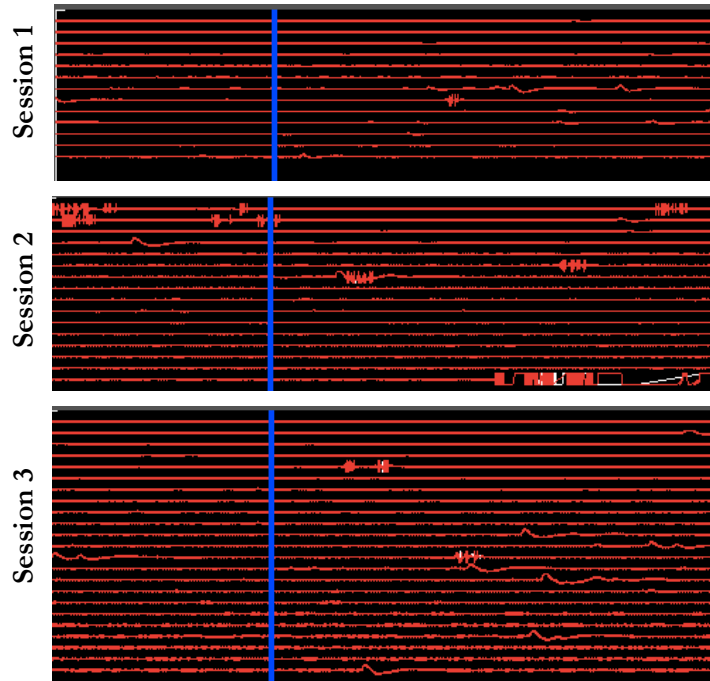

CONTROL ANIMAL

Pre-injury

Post Injury

STIM ON/OFF

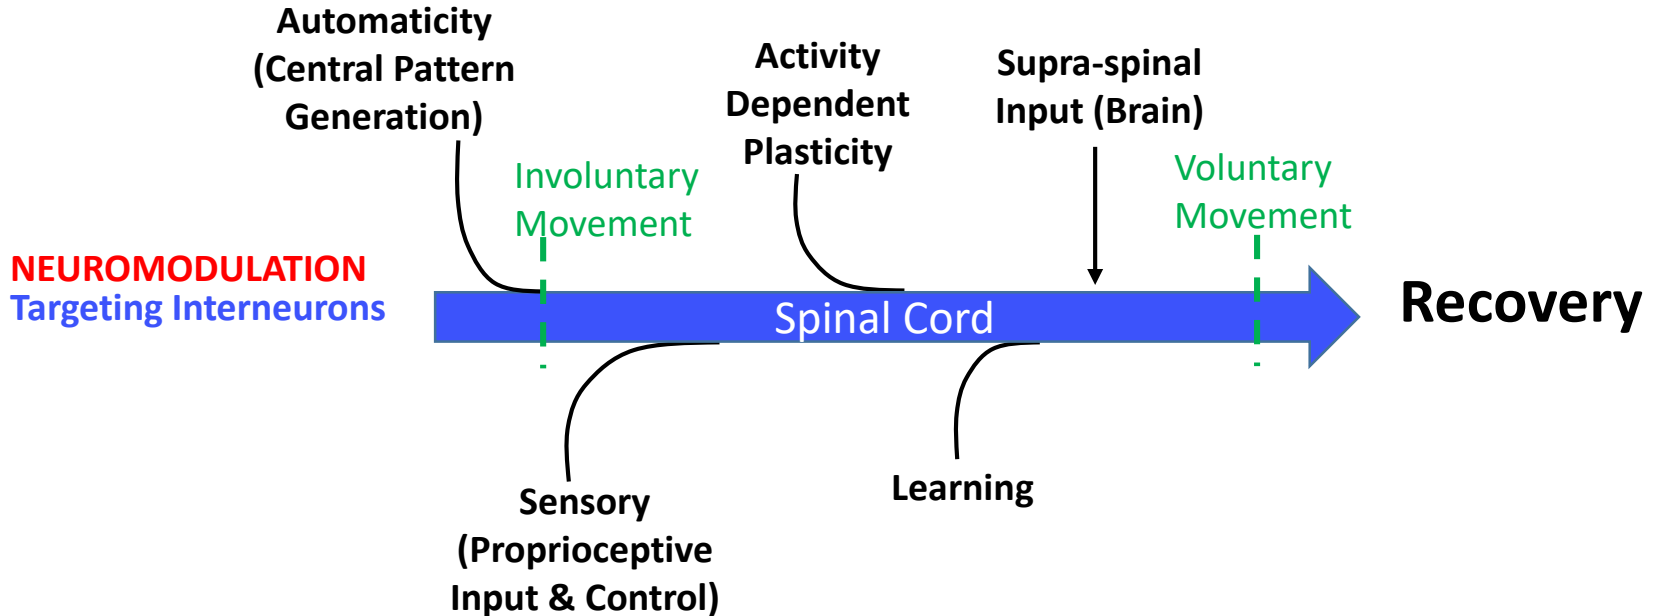

Neuromodulation of Bladder Function

Principles Underlying Recovery of Function

You don't have to think about the details
the spinal cord knows what to do

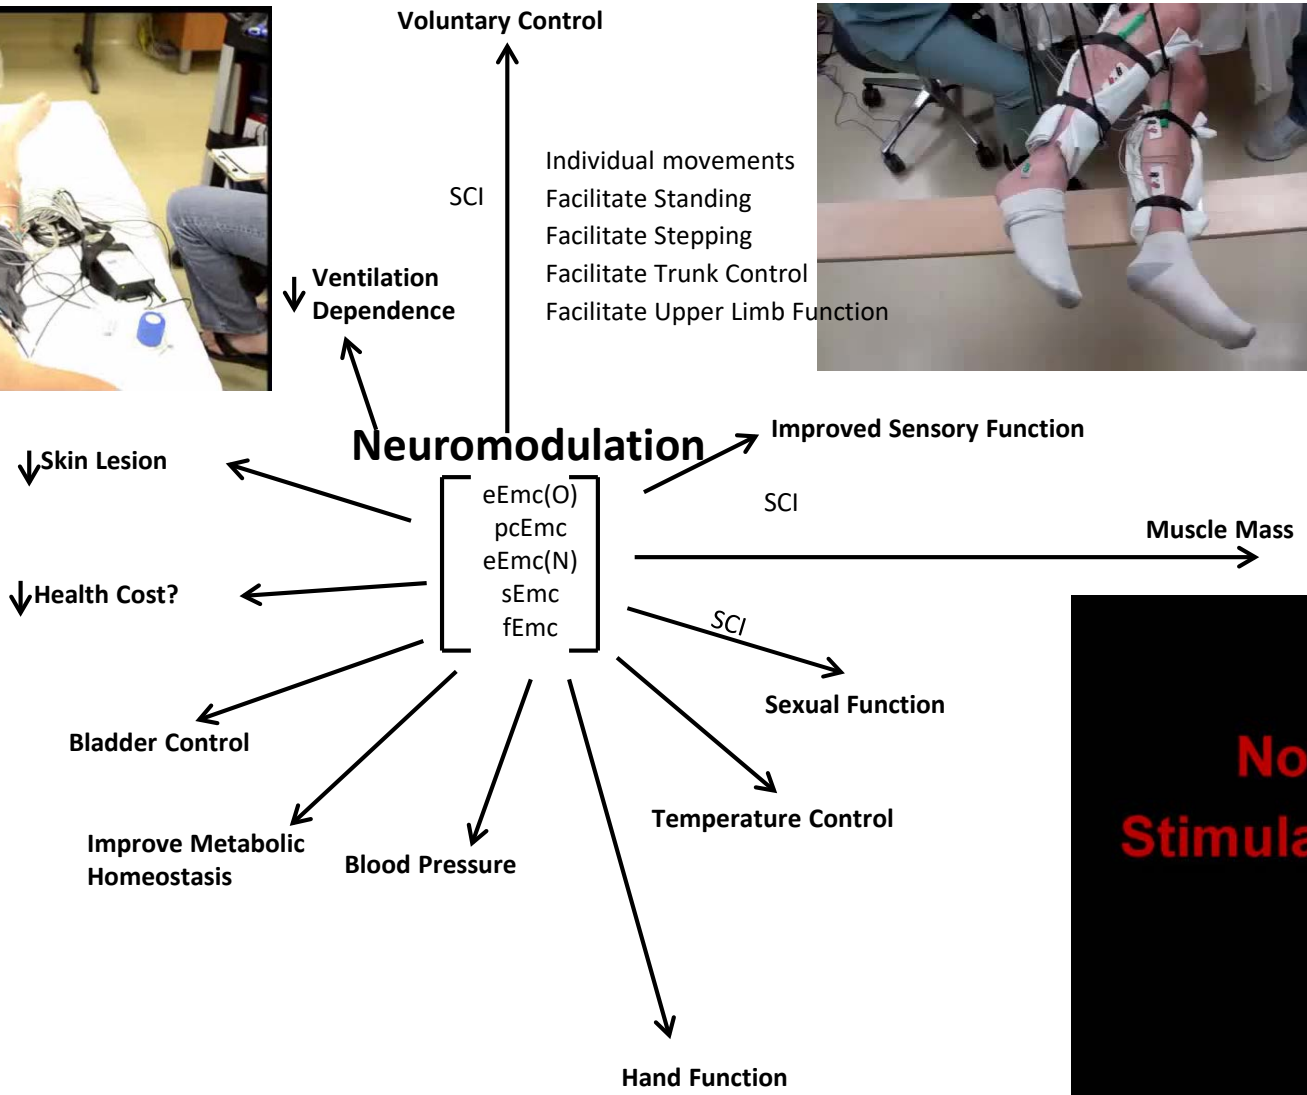

To **relearn** there must be re-engagement of the circuits

This can be accomplished **pharmacologically** and via **electrical** neuromodulation when combined with **training**

Previously unrecognized potential
levels of recovery of motor
function via neuromodulation and
neural plasticity

New clinical horizons

Individual movements
Facilitate Standing
Facilitate Stepping
Facilitate Trunk Control
Facilitate Upper Limb Function

No
Stimulation
