SUMMARY

4

# CENTRAL CORD SYNDROME (CCS)

“Disproportionately more motor impairment of the upper than of the lower extremities, bladder dysfunction, usually urinary retention, and varying degrees of sensory loss below the level of the lesion”

Schneider, 1954

# IMPACT

**Most common  
syndrome**

**Changing  
demographics**

**Huge variability  
in incidence**

**Changing  
pathophysiology**

**Clinical decision  
making - timing  
of surgery**

# CHANGING DEMOGRAPHICS

Year of Injury	Age at Injury			
	N	Mean	Standard Deviation	Minim
1972-1979	4,562	28.7	14.1	
1980-1984	4,949	30.5	14.7	
1985-1989	3,843	32.3	15.8

Engel-Haber, 2022

# CHANGING PATHOPHYSIOLOGY

Osteophytes compressing spinal cord. Hyperextension injury results in cord contusion, self-destructive edema and intramedullary hemorrhage with rapidly developing quadriplegia

Lower limb  
Trunk  
Upper limb

Section of cervical orientation of fibers in lateral cortico-spinal tracts

Central cord syndrome: central hemorrhage may damage medial part of lateral corticospinal tract and anterior horn-cells resulting in paralysis of upper limbs, leaving lower limbs intact

# CHANGING PATHOPHYSIOLOGY

Corticospinal tract

Levi, 2022

# TIMING OF SURGERY - DEBATE

**“Natural history is favorable. Operative intervention leads to poorer neurological recovery.”  
Schneider, 1954**

**“Early operative management (<24 h) Improves neurological and functional recovery.”  
Fehlings, 2012**

**“Early surgical decompression (<12 h) does not result in statistically significant or clinically meaningful neurological improvement.”  
Hosman, 2023**

# CONSIDERATIONS IN CCS<sup>a</sup>

Distal vs Proximal  
UE Weakness

Asymmetrical  
Weakness

Disproportionate  
Weakness

AIS Grades Used  
in Definition

Imaging / Injury  
Mechanism Used  
in Definition

<sup>a</sup>Engel-Haber, 2023

# CONSIDERATIONS IN CCS<sup>a</sup>

Distal vs Proximal  
UE Weakness

Asymmetrical  
Weakness

“Any type of acute sensory or motor deficit localized to the cervical spinal cord from a traumatic event in the **absence of fracture or dislocation**”. Avila, 2021

AIS Grades Used  
in Definition

Imaging / Injury  
Mechanism Used  
in Definition

“**Radiographic** and/or clinical presence of a cervical SCI **without ongoing compression**, which most often occurred after acute trauma in the setting of **pre-existing spondylosis and a narrowed canal**”. Lessing, 2020

Engel-Haber, 2023

# SUMMARY THUS FAR...

- The clinical diagnosis is deeply embedded in the clinical field
- Significant variation observed
- We support previous calls to revise the definition of CCS<sup>a,b</sup>

<sup>a</sup>Smith, 2021; <sup>b</sup>Badhiwala, 2020

# OBJECTIVES & METHODS

“Defining New, Quantifiable Criteria for Central Cord Syndrome”

- Objectives:

1. Define different clinical variations of CCS
2. Assess frequency, overlap with existing criteria
3. Compare outcomes

# OBJECTIVES & METHODS

“Defining New, Quantifiable Criteria for Central Cord Syndrome”

- Objectives:
  1. Define different clinical variations of CCS
  2. Assess frequency, overlap with existing criteria
  3. Compare outcomes
- SCIMS database (2010-2020)
- N=1,490 – individuals with motor incomplete tetraplegia (=Cervical with AIS C or D)
- Statistical analysis: descriptive, comparative (Chi-square, ANOVA)

# PROPOSED CCS SUBSETS

- Distal UE weakness
- Extent of symmetry

Type	Definition
<b>Full (bilateral) CCS</b>	$(\text{avg right LE} - \text{avg right distal UE}) \geq 2$ <b>AND</b> $(\text{avg left LE} - \text{avg left distal UE}) \geq 2$
<b>Unilateral CCS</b>	$(\text{avg right LE} - \text{avg right distal UE}) \geq 2$ <b>OR</b> $(\text{avg left LE} - \text{avg left distal UE}) \geq 2$

# RESULTS

- N=1490 with motor incomplete tetraplegia
- 52% had some variant of CCS:
  - 17.5% with full CCS
  - 25.6% with unilateral CCS
  - 9% with borderline CCS

# OVERLAP WITH EM-SCI

- N=582 (39%) fulfilled the EM-SCI criteria (LEMS – UEMS  $\geq$  10)
- Incomplete coverage. Not captured by the EM-SCI criteria:
  - 10% of full CCS
  - 36% of unilateral CCS
  - 52% of borderline CCS

## SUMMARY

4

# DISCUSSION & CONCLUSIONS

- Instead of a one-size-fits-all approach definition → delineated the most common variations
- Is it really a syndrome?

In motor incomplete tetraplegia:

- 52% with any CCS (17.5% full CCS)
- 66% with UEMS < LEMS (!!)

# DISCUSSION & CONCLUSIONS

- Limitations:
  - 1-year functional data not available on SCIMS
  - Still significant variation
- No clear reason to exclude CCS from studies
- Clinical & research benefits
- Needs review and validation

THANK YOU
