

Are you having trouble  
with reading faces?  
Traumatic brain injury  
can affect the ability to  
recognize emotions.

**Kessler Foundation needs your help to  
understand how traumatic brain  
injury influences emotion recognition.**

You may qualify for this study if you've sustained a traumatic brain injury and are between the ages of 18 and 65.

Study participation will last 8 weeks. The first week involves tests and surveys that examine emotional processing, quality of life, and thinking ability. There is also an optional brain scan and eye-tracking task for additional compensation.

You will then participate in a six-week training program that may improve emotional processing. In the last week, you will complete follow-up testing and an optional brain scan/eye-tracking task.

You will be compensated for your time.

Principal investigators for the study are Jean Lengenfelder, PhD and Helen Genova, PhD.
